

After running the PowerShell script to remediate STIG ID: WN10-CC-000327, there are two errors displayed (Refer to the photo)

[ERROR] Transcript output directory '\\CentralLogServer\PowerShellTranscripts' does not exist or is inaccessible.

[ERROR] Please ensure the network path is correct and accessible, and that you have the necessary permissions.

This error was triggered by the PowerShell script trying to verify or set permissions on the output folder specified:

\\CentralLogServer\PowerShellTranscripts

But that folder either doesn't exist yet or the computer can't reach it due to network or permission issues. Despite the error, the script successfully updated the registry to enable PowerShell transcription, so the setting **is enabled**. However, until the folder exists and is accessible with proper permissions, PowerShell won't be able to save the transcription logs there.

To fix this, we can create that folder on the server and share it so the machine can write to it. Once that's done, transcription logging will work fully.

Here are some main causes for this error:

1. The network path doesn't exist — the folder wasn't created yet on the target server.
2. Permission issue — the current machine/user didn't have access.
3. DNS or name resolution issue — CentralLogServer couldn't be resolved.
4. Firewall or sharing not set up — the server wasn't reachable over the network.
